In eelpout the taste organs or the taste buds are found  
beside the mustache, also on the lips, in the mouth  
cavity, in the throat, in the gill cavity, on the breast  
fins, in the skin cover of the head and on the belly. The  
fundamental apparatus of the taste bud appears to be the  
free extremities (endings) of the facial nerve. The  
olfactory organ of eelpout is located on the pair-type  
olfactory cavities of the skull which are covered with the

When components are fractionated of close boiling points, reflux formation in a homothermal condenser depends exclusively upon the amount of liquid in the latter and is independent of the amount of vapor entering the condenser per unit time. The dependence of the reflux formation upon the amount of liquid in the condenser is a linear function. (Author)

Hexonium, subcutaneously administered in doses of 2  
and 10 mg/kg, does not change the cholesterol and  
lecithin in the blood serum or the ascorbic acid con-  
tent of the adrenal glands in rabbits. Hexonium in the  
same doses inhibits the development of nutritional  
hypercholesterolemia, but does not change the lecithin  
content as compared with the lecithin content in rabbits
